In the Claims

1-23. (Cancelled)

24. (Newly Presented) An assembly for enclosing one or more electronic devices, comprising:

a receptacle having a plastic wall forming a cavity having an opening and a generally flat plastic flange surrounding the opening;

a first structural member of the building, wherein the flange is attached thereto;

a bracket attached to the flange and spanning the opening;

an outer wall layer disposed over the receptacle, bracket and first structural member.

25. (Newly Presented) The assembly of claim 24, wherein the plastic wall comprises a hole, and wherein the assembly further comprises a wire portion extending through the hole into the cavity.

26. (Newly Presented) The assembly of claim 25, wherein the wire portion forms a coil inside the cavity.

27. (Newly Presented) The assembly of claim 25, wherein the wire portion forms a zigzag inside the cavity.

28. (Newly Presented) The assembly of claim 24, further comprising a vapor barrier disposed between the flange and the outer wall layer.

29. (Newly Presented) The assembly of claim 24, wherein the vapor barrier is sealed to the flange.

30. (Newly Presented) The assembly of claim 29, further comprising an adhesive disposed between the vapor barrier and the flange.

31. (Newly Presented) The assembly of claim 24, wherein the plastic wall comprises a generally flat base.

32. (Newly Presented) The assembly of claim 31, wherein flat base comprises a raised pattern.

33. (Newly Presented) The assembly of claim 31, wherein the flat base comprises a printed pattern.

34. (Newly Presented) The assembly of claim 24, wherein the plastic wall comprises a pattern of concentric shapes.

35. (Newly Presented) The assembly of claim 34, where the pattern of concentric shapes is a pattern of circles.

36. (Newly Presented) An method of enclosing a low-voltage electronic device, comprising the steps of:

providing a receptacle having a plastic wall forming a cavity having an opening and a generally flat flange surrounding the opening;

positioning the receptacle within a wall of a building so as to allow the flange to contact a flat surface of a structural member of the building;

securing the flange to the structural member;

securing a bracket across the opening;

installing a wall layer;

forming a hole in the wall layer in communication with the opening of the cavity; and

attaching the low-voltage electronic device to the bracket.

37. (Newly Presented) The method of claim 36, further comprising the steps of:

providing a vapor barrier;

sealing the vapor barrier to the flange of the receptable; and

forming a hole in the vapor barrier in communication with the opening of the cavity of the receptacle.

38. (Newly Presented) The method of claim 37, further comprising the step of applying an adhesive to the flange.

39. (Newly Presented) The method of claim 36, wherein the plastic wall comprises a generally flat base portion.

40. (Newly Presented) The method of claim 39, wherein the flat base portion comprises a raised pattern.

41. (Newly Presented) The method of claim 39, wherein the flat base portion comprises a pattern of concentric geometric shapes.

42. (Newly Presented) The method of claim 41, wherein the patterns of concentric geometric shapes is a pattern of concentric circles.

43. (Newly Presented) The method of claim 36, further comprising the steps of:

forming a hole in the plastic wall; and

introducing a portion of a wire through the hole into the cavity.

44. (Newly Presented) The method of claim 43, further comprising the step of forming the wire portion into a zigzag pattern.

45. (Newly Presented) The method of claim 43, wherein the wire portion forms a coil.

46. (Newly Presented) The method of claim 43, further comprising the step of sealing the hole with a sealing subsequent to the introduction of the wire portion.

Respectfully submitted,

CRAIG A. JACKS

By his Attorney,
